

## FOCUS ON PERFORMANCE WITH SCENE-SPECIFIC OPTICS.

We engineered five unique lenses to create the ultimate combination of optics and aesthetics for high-speed riding. Each lens reflects and enhances a targeted spectrum of colors unique to its intended riding environment, to boost the contrast of scene-specific objects like gravel, glare, and soil.

### RIDESCAPE ES

Extra Sunny-tuned lenses minimize light transmittance to shield your eyes from extreme sunshine and blinding road glare. This reduces eye strain and makes differences in the ground's texture easier to see.

### RIDESCAPE RD

All-around Road-tuned lenses enhance certain colors and suppress others to boost asphalt contrast and visibility. This reduces eye strain and makes it easier to spot and react to hazards like potholes and rocks from afar.

### RIDESCAPE GR

Gravel-tuned lenses boosts the contrast of a wide range of surfaces to highlight subtle transitions between gravel, dirt, and asphalt.

### RIDESCAPE OR

Off-Road-tuned lenses reduce glare from sun leaks when riding in and out of the shade and sharpen visual awareness so you can react more quickly to various trail surfaces (rocks, soil, sand) and common obstacles (roots, stumps, gaps).

### RIDESCAPE CL

Cloudy-tuned lenses boost light transmittance for better visual performance in dark, cloudy, and wet riding situations. Anti-reflection coating reduces oncoming headlight glare.
